MORE PREVENTION. **LESS FRAUD.**

TWO WAYS TO MAKE POINT-OF-SALE EQUIPMENT SECURE

The point-of-sale terminal should be secured by using the support or the steel wire cable or better yet, a combination of the two. Merchants are encouraged to equip every place of business with at least one terminal that is adapted for use by individuals with limited mobility.

1   **SECURE SUPPORT**
The secure support helps prevent PIN-pad and terminal theft and also reduces the risk of other types of fraud at the point of sale. By using this type of device, you will also provide customers with a secure environment in which to process transactions.

⌐ A quick look at the benefits! ────────────────────────────

- ■ The support is equipped with a side-plate to conceal PIN entry, thus providing customers with an added security feature. The rotating support base or top lets your customers turn the terminal as needed.

- ■ The support is made up of robust, durable and non-flammable materials, thereby providing an added level of safety. The fastening mechanism ensures that the equipment is held solidly in place and protects it from being stolen.

- ■ Thanks to the security device, you may remove the terminal from its support for any technical service call. Make sure to properly check the technician's identity before allowing him to handle the equipment.

2   **STEEL WIRE SECURITY CABLE**
This locking system also offers good protection and may be custom made. The cable gives added handling flexibility for customers while also serving as a very efficient deterrent for potential fraudsters.

⌐ A quick look at the benefits! ────────────────────────────

- ■ The aviation-type cable is very sturdy and highly resistant.
- ■ The cable is secured under the counter via a strong, fixed latch that can be used on any type of surface.
